

Olympiad Test Paper — Social Science (Class 7) — Paper 5

Chapter 11: From Barter to Money

Paper 5 — (progressively harder)

Subject	Social Science (NCERT Class 7)
Chapter	11 — From Barter to Money
Total Questions	60 (Multiple Choice, single correct)
Maximum Marks	240
Suggested Time	90 minutes

Marking scheme: +4 for each correct answer · -1 for each wrong answer · 0 if unattempted.

Instructions: Each question has four options (A), (B), (C), (D); exactly one is correct.

Apex traps: a deal stays barter ONLY while every side is a good and nothing acts as a means of payment (a cowrie or coin added to balance instantly ends it); money arrived AFTER barter, caused BY its faults, never before; a note's worth is trust plus Reserve Bank of India backing, never the paper, ink, colour, or any hidden metal, so modern coins AND notes are fiat money while early coins were valued for their actual metal; cheques, demand drafts, debit cards, credit cards, and UPI all move the SAME existing rupees between accounts and create zero new currency (a transfer never changes the country's money total); each named barter defect (double coincidence of wants, no common measure of value, indivisibility, perishability/poor store of value, poor portability/durability) must be matched to EXACTLY its symptom and to the SINGLE money property that cures it; inflation lowers what a fixed sum buys over time; and the four functions (medium of exchange, store of value, common measure of value, standard of deferred payment) must each be read from the exact action described. Do not write on this paper — mark answers on your answer sheet.

1. A trader records four deals from one market day. Deal 1: a sack of millet handed straight across for a roll of jute, no figure named. Deal 2: a bullock given and two silver coins received back as 'change' to even the swap. Deal 3: a pot of curd swapped for a bundle of reeds, then the curd-giver hands over three cowrie shells to make the trade fair. Deal 4: a length of rope traded for a basket of dates, both judged equal by eye. Counting strictly, how many of the four are genuine barter, and on what principle?

- (A) Three are barter (Deals 1, 3 and 4), because cowrie shells are an old natural object and so do not count as money even when used to settle a balance.
- (B) One is barter (Deal 1 only), because any deal in which the two goods are not weighed against each other on a scale cannot count as a true swap.
- (C) All four are barter, because in every case a physical good was eventually handed over by each side.
- (D) Two are barter (Deals 1 and 4), because only there did goods meet goods with nothing acting as a means of payment; in Deals 2 and 3 the coins and the cowries served as money to settle the balance.

2. A teacher says, 'Identify the EARLIEST point at which a swap stops being barter.' A pure goods-for-goods exchange of wheat for cloth then passes through these stages in order: (i) the traders shake hands; (ii) they agree to meet weekly; (iii) one adds a handful of salt that both treat as a means of payment to balance the deal; (iv) the cloth is later resold. The swap first ceases to be barter at stage:

- (A) stage (iii), because the salt is being used as a means of payment, so something is now acting as money in the deal
- (B) stage (i), because the moment two people make a formal agreement the deal becomes a money contract rather than barter
- (C) stage (ii), because agreeing to repeat a trade turns it into a standard of deferred payment, which is a money function
- (D) stage (iv), because reselling the cloth proves the original deal must have used money

3. A blacksmith wants honey and offers tools. The beekeeper does not want tools; she wants leather. The tanner has leather but wants honey, not tools. A potter has honey but wants pots, not tools. The single barter defect that traps the blacksmith here, told apart from every other defect, is:

- (A) the absence of a double coincidence of wants, because no one who can supply what he needs also wants the exact goods he offers
- (B) the lack of a common standard measure of value, because the four traders cannot agree how many tools equal one jar of honey
- (C) indivisibility, because the blacksmith's tools cannot be split into small enough pieces to complete the deal
- (D) poor store of value, because the tools will rust before a willing partner can be found

4. Which everyday situation is the CLEANEST single case of a failed double coincidence of wants, with no other barter defect mixed in?

- (A) a dairyman whose pots of milk curdle each evening before he can arrange any swap
- (B) a tailor who needs eggs offers to stitch a shirt, but the only egg-seller in the village wants his roof mended, not stitching

- (C) a herder who cannot settle whether his bull is worth six sheep or ten sheep
- (D) a vendor whose sole asset is one heavy grindstone he cannot break apart to pay for a small handful of spice

5. Two villagers genuinely want each other's goods and are ready to trade, yet they part without a deal because one swears a goat equals four sacks of grain while the other swears it equals nine. Even if money were introduced, identify the SINGLE function of money that directly removes this particular deadlock.

- (A) money as a medium of exchange, because it lets each villager buy from anyone without needing the other to want their goods
- (B) money as a store of value, because it lets the goat's worth be saved safely for the future
- (C) money as a standard of deferred payment, because it lets the villagers agree to pay the difference next month
- (D) money as a common measure of value, because pricing the goat and the grain each in one unit settles instantly how much one is worth against the other

6. A herder owns one strong ox worth roughly twelve baskets of grain but today needs only one basket. In pure barter the small purchase cannot be completed. Which money property cures EXACTLY this trouble, and why is it not one of the others?

- (A) divisibility, because money can be split into a small unit equal to one basket, whereas a live ox cannot be cut into a twelfth
- (B) durability, because money lasts longer than an ox, which is the reason the small purchase fails
- (C) wide acceptance, because everyone takes money, which is the reason the small purchase fails
- (D) portability, because money is easy to carry, which is the reason the small purchase fails

7. A fruit-grower in a barter economy stays poor though his harvest is huge, because his only tradable wealth is crates of ripe papayas that soften within two days, and he often cannot swap them in time. Money would help him MOST directly by serving as a:

- (A) medium of exchange, because money would force buyers to start wanting papayas at once
- (B) store of value, because money does not spoil, so the worth of each day's harvest can be kept safely until he wishes to spend it
- (C) common measure of value, because money would make all the papayas weigh the same
- (D) standard of deferred payment, because money would let the papayas ripen more slowly

8. A merchant lists the faults of three barter goods he holds: oxen never rot but cannot be split for small deals; salt splits easily but dissolves in the monsoon; baskets of grain keep

for a season but are too bulky to carry far to market. Which single set of properties does GOOD money combine that no one of these three goods manages to combine?

- (A) edibility, heaviness and rarity together
- (B) wide acceptance, perishability and bulk together
- (C) durability, divisibility and portability together
- (D) the power to grow in amount the longer it is simply held

9. A classmate argues, 'Since the very first trade in history, people must have used some form of money.' Using the chapter's actual order of events, the strongest correction is that:

- (A) money and barter both began on the very same day, so neither came first
- (B) trade began as barter, and money was invented only later precisely to fix barter's troubles such as mismatched wants and no agreed measure of value
- (C) people first used digital transfers and only afterwards fell back on heavy metal coins
- (D) money came first and barter appeared later only when coins were temporarily lost

10. Which statement most precisely captures the cause-and-effect link the chapter draws between barter and money?

- (A) money was invented first and then deliberately introduced the faults that barter later showed
- (B) barter and its faults appeared at the same time as money, with no cause linking one to the other
- (C) barter had no real faults, so money was invented only to give kings something to stamp
- (D) barter's own faults, such as needing matched wants and lacking an agreed measure of worth, created the need that money was later invented to meet

11. Across one busy afternoon a vendor uses the same rupees in three ways, in this order: he chalks prices on a board so shoppers can compare two goods; he takes notes from a buyer and hands over a basket of plums; he locks part of the day's takings in a box to use next month. In order, money is acting as:

- (A) medium of exchange, then store of value, then common measure of value
- (B) store of value, then common measure of value, then medium of exchange
- (C) standard of deferred payment, then medium of exchange, then store of value
- (D) common measure of value, then medium of exchange, then store of value

12. A carpenter delivers a cupboard today; the buyer promises to pay 7,000 rupees in three months. Identify the function of money clearly at work, and the function clearly NOT at work, in the promise.

- (A) it is a standard of deferred payment, and it is not a medium of exchange, since no money passes hands at the moment of delivery
- (B) it is a medium of exchange, and it is not a store of value, since the cupboard has already left the workshop

(C) it is a common measure of value, and it is not a standard of deferred payment, because a future date has been fixed

(D) it is a store of value, and it is not a common measure of value, since the buyer set no price

13. A coin is sealed in a tin for six years and then spent on rice. Over that whole span, money served, in order, the functions of:

(A) store of value while it lay sealed, then medium of exchange when it bought the rice

(B) medium of exchange while sealed, then store of value when it bought the rice

(C) common measure of value while sealed, then standard of deferred payment when it bought the rice

(D) standard of deferred payment while sealed, then common measure of value when it bought the rice

14. Identify the ONE option in which money is NOT acting as a medium of exchange:

(A) handing coins to an autorickshaw driver to be taken across town

(B) writing '60 rupees' on a price tag so two shirts can be compared before any purchase

(C) tapping a debit card at a counter to carry home a bag of rice

(D) scanning a shop's QR code to pay for a plate of food on the spot

15. Grain, cattle, salt and cowrie shells once circulated as means of payment in early societies. The most exact label, and the precise reason it fits and the others do not, is:

(A) commodity money, because they were ordinary useful goods that also came to serve as a means of payment

(B) fiat money, because a government had declared each of them valuable by law

(C) legal tender, because a central bank had issued and guaranteed each of them

(D) digital money, because their worth could move between accounts without being touched

16. An ancient silver karshapana valued for the metal it contained sits beside a present-day 20-rupee note valued by trust and law. The deepest difference between how each gets its worth is that:

(A) both get their worth from the precious metal they contain, the coin from silver and the note from gold thread woven into the paper

(B) the early coin's worth came from the actual precious metal in it, while the note is fiat money whose worth comes from public trust and Reserve Bank backing

(C) the early coin was fiat money trusted by law, while the modern note is valuable for the costly material it is printed on

(D) neither has any real worth, since only barter goods can carry true value

17. Before minting, a trader carried tiny scales to weigh a lump of silver and bite-test its purity at every sale, which was slow and easy to cheat. Which feature of a minted, punch-

marked coin removed BOTH troubles in a single stroke?

- (A) the coin being struck from a more valuable metal than the lump, so it was always worth more
- (B) the coin being light enough to carry in large numbers, which sped up weighing
- (C) a fixed certified weight together with the official stamp, so the amount and the genuineness were both known on sight without weighing or testing
- (D) the coin being edible in a famine, which removed the need to test its purity

18. Two coins are compared after a year of daily handling: one struck from a single soft pure metal is worn flat and bent, while one struck from a hard alloy is still crisp. Which property of good money does this comparison most directly demonstrate, and why is the alloy used?

- (A) divisibility; the alloy lets the coin be split into smaller parts for tiny purchases
- (B) portability; the alloy makes the coin lighter so it is easier to carry
- (C) wide acceptance; the alloy forces everyone to take the coin in payment
- (D) durability; the alloy is harder, so the coin lasts a long time without wearing away in everyday use

19. A coin bears the national emblem on one face and the figure '5' with the word 'rupees' on the other. Using the correct coin terms, which statement is right?

- (A) the emblem face is the obverse (the 'heads' side) and the value face is the reverse (the 'tails' side)
- (B) the value face is the obverse and the emblem face is the reverse
- (C) both faces are called the obverse, while only the rim is the reverse
- (D) the emblem face is the edge and the value face is the obverse

20. The English word 'rupee' descends from the Sanskrit 'rupya'. Knowing what 'rupya' meant, which pairing of meaning and reason is correct?

- (A) 'rupya' meant printed paper, which fits because the rupee began life as a paper note
- (B) 'rupya' meant wrought or stamped silver, which fits because India's early coins were struck from silver
- (C) 'rupya' meant cowrie shell, which fits because the rupee began as a shell used in trade
- (D) 'rupya' meant quick response, which fits because the rupee began as a scanned digital code

21. A scholar studies a hoard of old karshapanas to work out which ancient king ruled a region and how trade flowed in his time. This scholar is practising:

- (A) minting, since handling coins is the same activity as producing them
- (B) bartering, since examining coins means swapping them for information
- (C) numismatics, the study of coins and paper money for the history they reveal
- (D) inflation control, since studying old prices means setting modern ones

22. Paper currency was first used in one ancient country and spread elsewhere, including India, only much later. Which statement pairs the origin with a genuine advantage of notes over coins?

- (A) paper money was first used in India, and the paper itself was more precious than the metal of coins
- (B) paper money was first used in ancient Rome, and notes could never be torn or lost
- (C) paper money was first used in Britain, and the rarity of the paper gave each note its worth
- (D) paper money was first used in China, and notes were lighter and easier to carry in large amounts than heavy metal coins

23. Suppose every state and every bank in India were each allowed to print its own different banknotes. Which problem would this MOST directly cause, and which body actually prevents it in reality?

- (A) notes would turn into precious metal; the United Nations prevents this by approving each design
- (B) notes would last far longer; each state treasury prevents this by recalling worn notes
- (C) notes would automatically become coins; local shopkeepers prevent this by stamping them
- (D) notes would stop being uniform and equally trusted everywhere; the Reserve Bank of India prevents this by being the sole issuer

24. Two children debate why a banknote is accepted across India. One points to the Governor's signature and the Reserve Bank's name printed on it; the other points to the bright colours and fine patterns. Whose evidence better explains the note's acceptance, and why?

- (A) the second child, because the colours and patterns are themselves worth the note's face value
- (B) the second child, because a note's worth comes entirely from how attractive it looks
- (C) the first child, because the central bank's signature and name show official backing, which is the real source of the public trust that makes the note accepted
- (D) neither child, because a note is accepted only for the recycling value of its paper

25. Which one of these is fiat money, valued by trust and law rather than by the worth of its material?

- (A) a present-day 50-rupee note issued by the Reserve Bank of India
- (B) a cowrie shell once swapped directly for a measure of grain in a village
- (C) an ancient silver coin prized for the precious metal it contained
- (D) a head of cattle handed over in payment in early times

26. A modern coin's metal is worth only about 80 paise, yet the coin spends everywhere at its stamped value of 2 rupees. The single best reason is that:

- (A) the stamped 2 rupees is only a decoration, and the coin really changes hands for 80 paise of metal
- (B) the coin must secretly contain hidden metal worth a full 2 rupees, or it could not be spent
- (C) it is fiat money: by law it is legal tender and people trust and accept it at its face value, regardless of the metal's worth
- (D) the coin is actually a form of barter, since metal is being swapped for goods

27. A biscuit pack cost 20 rupees three years ago and costs 25 rupees today, while a worker's daily pay has stayed at 200 rupees the whole time. Reasoning about how many packs a full day's pay buys, the correct description is:

- (A) this is deflation; a day's pay now buys more packs than before, so its purchasing power has risen
- (B) this is inflation; a day's pay that once bought 10 packs now buys only 8, so the pay's purchasing power has fallen
- (C) this is barter; the day's pay has automatically turned into the goods it can buy
- (D) purchasing power is unchanged, since the worker still earns the same 200 rupees each day

28. A grandparent keeps exactly 1,000 rupees in cash in a drawer for ten years. Over that decade prices roughly double. Which statement best describes what has happened to the money's worth and why?

- (A) the 1,000 rupees has doubled to 2,000 on its own to keep pace with prices
- (B) the 1,000 rupees has lost its legal-tender status simply by lying in the drawer for years
- (C) the 1,000 rupees buys exactly the same goods, since the number on the notes never changed
- (D) the 1,000 rupees still reads the same, but because of inflation it now buys only about half as much, so its real worth has fallen

29. A shopkeeper banks his daily takings each evening instead of keeping cash at home. Which list correctly states what the bank does for him AND what it does not do?

- (A) it prints new currency for him each evening; it does not keep his money safe overnight
- (B) it keeps his money safe and lets him pay and transfer electronically; it does not set the prices in his shop or choose his customers
- (C) it mints the coins he gives as change; it does not allow any electronic transfers
- (D) it barter's his takings for goods each night; it does not let him withdraw when he needs cash

30. A cheque is best described, and best distinguished from cash, as:

- (A) a written instruction telling a bank to pay a stated sum from the writer's account to a named person, moving money between accounts rather than passing notes by hand
- (B) a brand-new currency printed by the shopkeeper who receives it
- (C) a coin made of paper instead of metal, spent like ordinary loose change
- (D) a form of barter that swaps documents directly for goods without any money

31. A stranger insists on being paid by a bank demand draft rather than by a personal cheque. The best reason is that a demand draft:

- (A) is paid for in advance at the bank, so the money is guaranteed to be available, unlike a cheque that might bounce
- (B) is a brand-new currency that only strangers are permitted to use
- (C) turns the payment into a barter of bank papers between the two parties
- (D) creates extra rupees that an ordinary cheque is unable to create

32. Riya taps a card and the amount leaves her own bank balance instantly. Sahil taps a card and his bank pays the shop now while he settles the bill at the end of the month. Which card does each use?

- (A) Riya uses a credit card and Sahil uses a debit card
- (B) both use debit cards, since neither paid in physical cash
- (C) both use credit cards, since both used a machine instead of notes
- (D) Riya uses a debit card, which draws money she already has, while Sahil uses a credit card, which borrows money to be repaid later

33. Before a UPI payment, account A holds 600 rupees and account B holds 100 rupees, a total of 700. A pays B 250 rupees by UPI. Reasoning from this, which statement about the country's total money is correct, and what are the new balances?

- (A) the total rises to 950, because the bank creates 250 fresh rupees during the transfer
- (B) the total falls to 450, because 250 rupees are destroyed once they leave account A
- (C) the total stays 700 (now 350 in A and 350 in B), because UPI only shifts existing rupees from one account to another and creates none
- (D) the total becomes gold of equal worth, because UPI converts rupees while moving them

34. Which everyday observation BEST shows that UPI is just a way of paying and not a separate currency of its own?

- (A) a UPI payment can be made only on certain days of the week
- (B) a UPI app displays its amounts in a unit that is not the rupee
- (C) money sent through UPI can never afterwards be turned back into cash at a bank
- (D) the very same account balance can be spent as cash, by card, or by UPI, and all three draw on the identical rupees

35. Four shoppers each pay 50 rupees for the same item: one by cash, one by cheque, one by debit card, and one by UPI. Which single statement about all four payments is TRUE?

- (A) only the cash payment uses real money; the other three are forms of barter
- (B) each method uses a different currency, so the four shoppers paid in four different monies
- (C) the three non-cash methods each created brand-new rupees at the moment of payment
- (D) every one of them moves the same 50 rupees; only the method of moving the money differs

36. A learner draws one arrow to show the long-run change in HOW most trade has been settled, from the distant past to today. Which arrow is correct?

- (A) electronic transfers such as UPI, then coins and notes, then direct goods-for-goods swaps
- (B) coins and notes, then direct goods-for-goods swaps, then electronic transfers such as UPI
- (C) direct goods-for-goods swaps, then coins and notes, then electronic transfers such as UPI
- (D) direct goods-for-goods swaps, then electronic transfers such as UPI, then coins and notes

37. Place these on the timeline of money in correct earliest-to-latest order: paper currency, barter, metal coins, commodity money such as cowrie shells.

- (A) commodity money such as cowrie shells, then barter, then paper currency, then metal coins
- (B) metal coins, then barter, then commodity money such as cowrie shells, then paper currency
- (C) paper currency, then metal coins, then commodity money such as cowrie shells, then barter
- (D) barter, then commodity money such as cowrie shells, then metal coins, then paper currency

38. Which single statement is the MOST complete and accurate summary of the whole chapter?

- (A) money has always existed, is valuable only as precious metal, and UPI is a separate new currency
- (B) barter is identical to using money, and a note's value lies entirely in the paper it is printed on
- (C) trade moved from barter to commodity money to coins to paper to digital payments, and today's money is valued by trust and Reserve Bank backing, while UPI and cards merely move the same rupees
- (D) digital payments came first, then barter, and notes are worth their weight in gold

39. Assertion (A): A torn and faded 10-rupee note can still buy goods worth far more than the paper it is printed on. Reason (R): The note's value comes from public trust and

Reserve Bank backing rather than from its material. Choose the best option.

- (A) Both A and R are true, but R does not explain A
- (B) Both A and R are true, and R correctly explains A
- (C) A is true but R is false
- (D) A is false but R is true

40. Assertion (A): Paying by UPI does not change how many rupees exist in the country.
Reason (R): UPI creates entirely new money each time a payment is made. Choose the best option.

- (A) A is true but R is false
- (B) Both A and R are true, and R explains A
- (C) Both A and R are true, but R does not explain A
- (D) A is false but R is true

41. Assertion (A): A modern 2-rupee coin is accepted at full value even though the metal in it is worth less than 2 rupees. Reason (R): Modern coins are fiat money, accepted through legal-tender status and trust rather than for their metal. Choose the best option.

- (A) Both A and R are true, but R does not explain A
- (B) A is true but R is false
- (C) Both A and R are true, and R correctly explains A
- (D) A is false but R is true

42. Assertion (A): In pure barter a baker who wants cloth must find a weaver who happens to want bread at that very moment. Reason (R): Money's wide acceptance is what removes the double coincidence of wants. Choose the best option.

- (A) Both A and R are true, and R correctly explains A
- (B) Both A and R are true, but R does not explain A
- (C) A is true but R is false
- (D) A is false but R is true

43. If, overnight, no one in a country trusted its banknotes any more, the most likely immediate consequence would be that:

- (A) the paper of the notes would instantly turn into precious metal of equal value
- (B) people would hesitate to accept the notes, and trade settled in them would break down, because the notes' worth rested on that very trust
- (C) the notes would automatically become worth more than before
- (D) barter would become impossible everywhere at the very same moment

44. A trader lists three woes of barter, in this order: 'I cannot find anyone who wants my pots; we cannot agree how many pots equal one blanket; and a single large pot cannot pay for one small needle.' These three correspond, in order, to:

- (A) no common measure of value; indivisibility; no double coincidence of wants
- (B) indivisibility; poor store of value; no common measure of value
- (C) no double coincidence of wants; no common measure of value; indivisibility
- (D) poor store of value; no double coincidence of wants; poor portability

45. From the rows below, choose the ONE in which the money feature is correctly matched to the exact barter trouble it removes.

- (A) divisibility removes the inability to split one large good to pay for a small purchase
- (B) durability removes the disagreement over how many of one good equal another
- (C) portability removes the failure to find a trader who wants one's exact goods
- (D) wide acceptance removes the spoiling of perishable goods before they can be traded

46. Four students each make one claim. P: 'Barter still survives in some places even today.' Q: 'A banknote is really worth its weight in gold.' R: 'UPI is a brand-new currency separate from the rupee.' S: 'Money was invented before barter ever began.' Exactly one is correct. Who is it?

- (A) Q, because a note is valued by the weight of gold hidden in its paper
- (B) R, because UPI runs on a different currency from the ordinary rupee
- (C) S, because money came into use before barter in human history
- (D) P, because barter does still survive in some places, such as at certain fairs, even in the age of money

47. A class is asked for the single BEST reason money replaced barter as the main way to trade. The strongest answer is that money:

- (A) is widely accepted and serves as a common measure and store of value, so it removes the need to find someone who wants one's exact goods
- (B) is always made of precious metal that can never lose any of its value
- (C) lets people stop producing goods altogether and simply live off coins
- (D) forces every trader in a market to want the same single product

48. An essay claims, 'Barter had no real problems, so money was invented only to make notes out of specially precious paper.' Which single correction fixes BOTH errors at once?

- (A) barter truly had no problems, and a note's value really does lie in its costly paper
- (B) barter's only problem was that its paper was too cheap, which money fixed with better paper
- (C) barter was perfect, so money's paper simply had to be made of gold to compete with it
- (D) barter had serious problems such as mismatched wants and no agreed measure of value, and a note's worth rests on trust and Reserve Bank backing, not on any precious paper

49. Legal tender means money that, by law, must be accepted to settle a payment within a country. Which everyday consequence follows DIRECTLY from a 10-rupee coin being legal tender in India?

- (A) the coin can be spent only in foreign countries and never within India
- (B) the coin is guaranteed to contain 10 rupees' worth of precious metal

- (C) a shopkeeper in India cannot lawfully refuse the coin when a customer offers it to settle a small bill
- (D) any seller may turn the coin away simply because they dislike its design

50. Two herders agree they want each other's goods AND agree a fair rate, yet the deal still collapses because one can offer only a single living camel while the other needs to pay for just one small water-skin. The barter defect at work, and the money property that would cure it, are:

- (A) no double coincidence of wants, cured by money's wide acceptance
- (B) no common measure of value, cured by money's role as a measuring unit
- (C) poor store of value, cured by money's durability over time
- (D) indivisibility, cured by money's divisibility into small units

51. A buyer pays a distant supplier by cheque instead of carrying a bag of cash across the city. The clearest single advantage of the cheque here is that it:

- (A) instructs the bank to move the rupees between accounts, so no heavy cash has to be carried and risked on the journey
- (B) creates extra rupees that the cash could never have created
- (C) turns the rupees into a more valuable currency during the transfer
- (D) changes the payment into a barter of paper for goods

52. A student writes three claims in one line: (i) barter is goods-for-goods with no money; (ii) early coins were valued for their actual precious metal, while modern coins and notes are fiat money; (iii) UPI creates fresh rupees with every payment. Which combination is entirely correct?

- | | |
|-------------------------|------------------------|
| (A) (ii) and (iii) only | (B) (i) and (iii) only |
| (C) (i) and (ii) only | (D) all three |

53. A market historian compares two markets. Market X uses a single agreed measuring-unit so every good is priced in it; Market Y is pure barter. Which statement best explains why X runs far faster than Y for a shopper buying several different goods?

- (A) in X all goods are forced to weigh the same, so they trade strictly one-for-one
- (B) in X every buyer is made to want the identical product, so no choices slow things down
- (C) in X each good has one price in the same unit, so any two goods compare at a glance, while in Y a fresh good-for-good ratio must be haggled for every pair
- (D) in X perishable goods are preserved forever, so nothing has to be sold quickly

54. A child reasons, 'A 500-rupee note is just expensive paper, so two notes must be made of twice as much precious material as one.' Identify the deepest error in this reasoning.

- (A) the error is only in the arithmetic; two notes are in fact worth three times as much precious material, not twice
- (B) the value of a note does not come from its material at all, so neither note carries precious material whose amount could be doubled; both are fiat money valued by trust and Reserve Bank backing
- (C) the error is that the paper of a 500-rupee note really is precious, but a single note already holds the full value
- (D) there is no error, because notes truly get their worth from the precious paper they are printed on

55. A village suddenly has no banks at all. Reasoning about the consequences, which everyday activity would become HARDEST as a DIRECT result, and why?

- (A) growing crops in the fields each season, because farming needs a bank to issue seeds
- (B) walking from one house to another in the village, because paths require bank funding
- (C) safely storing savings and sending money electronically, because cheques, cards, and UPI all depend on bank accounts that no longer exist
- (D) speaking the local language with neighbours, because language depends on bank records

56. A teacher writes: 'Trade history runs barter, then commodity money, then minted coins, then paper currency, then digital payment.' A student is asked which earlier stage solved the problem of weighing and testing loose metal at every sale, and which later stage solved the heavy weight of carrying many coins. The correct pair is:

- (A) commodity money solved the weighing problem; digital payment solved the heavy-coin problem first of all
- (B) paper currency solved the weighing problem; minted coins solved the heavy-coin problem
- (C) minted coins solved the weighing-and-testing problem; paper currency solved the heavy-weight-of-coins problem
- (D) barter solved the weighing problem; commodity money solved the heavy-coin problem

57. A scenario lists four payments and asks which involves money acting in TWO different functions within the single act described. A buyer looks at a price tag reading '300 rupees', decides it is fair compared with a rival shop's tag, and immediately hands over 300 rupees to take the goods. Which two functions appear, in order?

- (A) store of value (reading the tag) and then standard of deferred payment (paying on the spot)
- (B) common measure of value (comparing the priced tags) and then medium of exchange (handing over money for the goods)

(C) medium of exchange (reading the tag) and then store of value (handing over money)

(D) standard of deferred payment (comparing tags) and then common measure of value (paying on the spot)

58. Comparing the source of worth across three forms, which ordering correctly ranks them from 'worth comes mainly from the object's own usefulness or material' to 'worth comes mainly from trust and law'?

(A) a modern rupee note, then an ancient silver coin, then a sack of salt used as commodity money

(B) a sack of salt used as commodity money, then an ancient silver coin valued for its metal, then a modern rupee note backed by the Reserve Bank

(C) an ancient silver coin, then a modern rupee note, then a sack of salt used as commodity money

(D) a modern rupee note, then a sack of salt used as commodity money, then an ancient silver coin

59. A young trader says, 'I will keep all my wealth as goats, because goats are useful and everyone in my barter village will surely want them.' Reading the chapter's lessons, which single drawback should worry him MOST if he plans to save this wealth for many years?

(A) goats are too easy to divide into small parts, which would scatter his wealth

(B) goats are a poor store of value, because they can fall ill, age, or die, so the saved wealth may shrink or vanish over the years

(C) goats are fiat money, so a change in the law could cancel their value overnight

(D) goats are too portable, so they would wander away and be spent without his choosing

60. A reformer proposes, 'Let us go back to pure barter and abolish money entirely, so trade becomes simpler.' Using the chapter's reasoning, the strongest single objection is that abolishing money would:

(A) bring back every barter trouble at once, since people would again need matched wants, an agreed measure of value, divisible goods, and durable goods, which money had solved together

(B) make all goods instantly perishable, because only money keeps goods from rotting

(C) be impossible because barter has never existed anywhere in human history

(D) leave trade unchanged, since barter and money work in exactly the same way

Solutions — Social Science (Class 7), Chapter 11: From Barter to Money — Paper 5

Paper 5 — (progressively harder)

Marking: +4 correct, –1 wrong, 0 unattempted. Maximum marks **240**.

Answer-key distribution: A = 15, B = 15, C = 15, D = 15.

Worked Solutions

1. (D) The rule is that a deal stays barter only while every side is a good and nothing functions as a means of payment. Deals 1 and 4 are pure goods-for-goods, so they qualify. The choice claiming three are barter is wrong because cowrie shells, the moment they are used to settle a balance, are acting as commodity money, which disqualifies Deal 3. The choice claiming only Deal 1 is wrong because barter never required goods to be weighed on a scale; Deal 4's by-eye equal swap is still barter. The choice claiming all four is wrong because Deal 2 used silver coins as change, which is money entering the deal, so it is a purchase, not barter.

2. (A) Barter ends the instant anything acts as a means of payment, and that is stage (iii) where salt plays the role of money to balance the swap. Shaking hands at stage (i) adds no money, so it remains barter. Agreeing to meet weekly at stage (ii) is just scheduling; no deferred money payment is promised, so it is still barter. Reselling the cloth at stage (iv) is a separate later act and says nothing about whether the original wheat-for-cloth swap used money.

3. (A) The chain shows everyone wanting something other than the blacksmith's tools, which is precisely the failure of a double coincidence of wants. The measure-of-value option is wrong because the problem is not disagreement over a price ratio; no partner is even willing to take tools. The indivisibility option is wrong because nothing in the scenario turns on splitting a good. The store-of-value option is wrong because rusting is never mentioned and is not what blocks the deal; the block is mismatched wants.

4. (B) The tailor case is pure mismatched wants: a willing trade exists in goods but the one available partner wants something different, with no spoilage, no ratio dispute, and no splitting issue. The curdling-milk option introduces perishability (poor store of value). The bull-worth option introduces the absence of a common measure of value. The grindstone option introduces indivisibility. Only the first isolates the double-coincidence failure cleanly.

5. (D) The deadlock is a pure disagreement over relative worth, exactly what a common measure of value fixes by giving each good one priced figure. The medium-of-exchange option targets mismatched wants, which is not the problem here since both already want to trade. The store-of-value option targets perishability or saving, not a pricing dispute. The standard-of-deferred-payment option targets future-dated debts, but the trade fails now over value, not over timing.

6. (A) The block is that a whole ox cannot be reduced to the tiny fraction the deal needs, which is the indivisibility problem cured by money's divisibility. Durability is about lasting over time, not about splitting for a small buy. Wide acceptance solves mismatched wants, not the size mismatch here, since the trouble is not finding a willing partner. Portability is about carrying, which is unrelated to splitting a single large good into a small payment.

7. (B) His loss comes from papayas rotting before he can trade, a perishability failure that money cures by being a durable store of value. The medium-of-exchange option misstates that function, which is about being accepted by anyone, not forcing buyers to want a good. The common-measure option is irrelevant and absurdly claims money changes the weight of fruit. The standard-of-deferred-payment option wrongly suggests money slows ripening, which it cannot; the issue is storing worth, not preserving the fruit itself.

8. (C) Each good fails on one axis: the ox on divisibility, salt on durability, grain on portability; good money has all three at once, so the correct set is durability, divisibility and portability. The edibility option lists qualities money does not need and that do not solve the listed faults. The acceptance option pairs a real money virtue with two defects (perishability and bulk) that money must avoid. The growth option describes interest-like multiplication, which is not a property money has merely by being held.

9. (B) The chapter's order is barter first, then money invented to cure barter's faults, which is the correct rebuttal. The same-day option denies the cause-and-effect sequence the chapter draws. The digital-first option reverses the entire timeline, since digital money

is the most recent stage. The money-first option flatly inverts history and wrongly treats barter as a fallback for lost coins.

10. (D) The chapter presents money as a solution that arose because barter's defects made trade hard, so the cause is barter's faults and the effect is money's invention. The money-first option reverses cause and effect. The simultaneous option denies the causal chain the chapter builds. The no-faults option contradicts the whole premise, since the chapter lists barter's faults as the reason money was needed.

11. (D) Pricing for comparison is the common measure of value; taking notes for goods on the spot is the medium of exchange; locking takings away for later is the store of value, giving that exact order. The second option scrambles the order. The third option also scrambles it, putting store of value first. The fourth option mislabels the pricing act as a standard of deferred payment, which involves a future-dated debt, not a comparison made now.

12. (A) A promise to pay a stated sum at a future date is the standard of deferred payment, and because no money changes hands now it is not functioning as a medium of exchange, so the first option is right. The second wrongly calls a future promise a present exchange. The third is self-contradicting: fixing a future date is exactly what makes it a standard of deferred payment, not what rules it out. The fourth wrongly says no price was set, when 7,000 rupees clearly is the agreed sum.

13. (A) Lying sealed preserves worth, which is the store-of-value function, and then being handed over for rice is the medium-of-exchange function, giving that order. The second option swaps the two roles. The third and fourth options misapply pricing (common measure) and future-debt (deferred payment) functions, neither of which describes a coin simply resting in a box and then buying goods on the spot.

14. (B) A price tag is used to compare worth before buying, which is the common measure of value, not a medium of exchange. Handing coins to the driver, tapping a card to take goods, and scanning a QR code to pay are all payments that move money for goods or services on the spot, which is the medium-of-exchange function. Only the price-tag case is a different function.

15. (A) These items were everyday useful goods that doubled as payment, which is exactly commodity money. The fiat option fails because no government decree gave them value; their value came from their usefulness. The legal-tender option fails because no central bank issued or guaranteed grain or cowries. The digital option fails because these were physical goods, not electronic balances moving between accounts.

16. (B) Early coins were valued for their genuine metal content, while modern notes are fiat money resting on trust and Reserve Bank backing, which is the true contrast. The first wrong option invents gold thread in the note, a classic precious-paper trap. The second

reverses the two cases, mislabelling the early coin as fiat and the note as material-valued. The fourth denies that money has worth at all, contradicting the chapter.

17. (C) A minted coin's fixed weight ended the need to weigh, and its certifying stamp ended the need to test purity, curing both troubles at once. The more-valuable-metal option does not address weighing or testing and is not why minting helped. The portability option only touches carrying, not weighing or purity-testing. The edibility option is irrelevant and false, since coins are not food and that would not certify purity.

18. (D) The contrast is about wear over time, which is durability, and alloys are chosen because they are harder and survive handling. The divisibility option is wrong because the comparison is about wear, not splitting. The portability option is wrong because alloys are not chosen to reduce weight and the scenario says nothing about carrying. The wide-acceptance option is wrong because acceptance comes from trust and law, not from the metal's hardness.

19. (A) The main design or emblem side is the obverse (heads) and the other side is the reverse (tails), so the emblem face is the obverse. The second option reverses these names. The third wrongly says both faces are the obverse and miscalls the rim the reverse. The fourth confuses the edge with a face, which is incorrect.

20. (B) 'Rupya' meant wrought or stamped silver, matching India's early silver coins. The printed-paper option is wrong because the rupee began as a metal coin, not paper. The cowrie option confuses commodity money with the coin's name and origin. The quick-response option is an anachronistic pun on QR codes and has nothing to do with the Sanskrit root.

21. (C) Reading coins as historical evidence is numismatics. Minting is the making of coins, not their study. Bartering is swapping goods for goods and has nothing to do with examining a hoard. Inflation control is about managing prices and is unrelated to studying ancient coins for history.

22. (D) Paper money began in China, and its real advantage was lightness and ease of carrying large sums, improving portability. The India option is wrong on origin and falsely claims the paper is precious. The Rome option is wrong on origin and absurdly claims notes cannot be torn or lost. The Britain option is wrong on origin and repeats the precious-paper trap, since a note's worth comes from trust, not rare paper.

23. (D) Many issuers would destroy the uniformity and shared trust a single currency needs, which is why the Reserve Bank of India alone issues notes. The precious-metal option is nonsense and wrongly hands the role to the United Nations. The longer-lasting option misstates the consequence and the preventing body. The notes-into-coins option is incoherent and falsely gives shopkeepers an issuing role.

24. (C) Acceptance rests on trust grounded in Reserve Bank backing, which the signature and bank name signal, so the first child is right. The first second-child option falsely claims the colours equal the face value. The second second-child option wrongly bases worth on appearance. The neither option repeats the precious-paper trap by reducing the note to its paper's recycling value, ignoring trust and backing.

25. (A) A modern note backed by the Reserve Bank is fiat money, valued by trust and legal-tender status, not by its material. The cowrie shell was commodity money valued as a useful object. The ancient silver coin was valued for its actual metal, not by decree. Cattle handed over in payment is commodity money valued as a useful good. Only the modern note is fiat money.

26. (C) A coin spending above its metal worth is the hallmark of fiat money backed by legal-tender status and trust. The decoration option wrongly claims the face value is ignored and the coin trades for its metal, which contradicts everyday use. The hidden-metal option invents extra metal to force a metal-equals-face-value rule that fiat money does not follow. The barter option is wrong because a money purchase, not a goods-for-goods swap, is happening.

27. (B) Prices rose from 20 to 25 rupees, which is inflation; 200 rupees bought 10 packs before (200 divided by 20) but only 8 packs now (200 divided by 25), so purchasing power fell. The deflation option is wrong because prices rose, not fell, and the pay buys fewer, not more. The barter option misuses the term, since money, not goods-for-goods swapping, is involved. The unchanged option is the key trap: the same rupee figure hides a real fall in what it buys.

28. (D) With prices doubling, the same 1,000 rupees buys about half as much, so inflation has cut its real purchasing power even though the figure is unchanged. The doubling option is wrong because cash does not multiply by itself. The legal-tender option is wrong because notes do not lose legal status merely by being stored. The last option is the trap of confusing the unchanged number with unchanged buying power, which inflation has in fact reduced.

29. (B) Banks safeguard deposits and enable electronic payments and transfers, but they do not set a shop's prices or pick its customers, so the first option is right. The printing option is wrong because banks do not print currency and certainly do keep money safe. The minting option is wrong because banks do not mint coins and do allow electronic transfers. The barter option is wrong on both counts, since banks do not swap takings for goods and do permit withdrawals.

30. (A) A cheque instructs a bank to move a stated sum between accounts, which both defines it and distinguishes it from handing over physical notes. The new-currency option is wrong because a cheque creates no money; it directs existing rupees. The paper-coin

option is wrong because a cheque is not itself spendable currency. The barter option is wrong because rupees, not goods-for-goods swapping, settle the payment.

31. (A) A demand draft is prepaid at the bank, so the funds are certain, which a personal cheque cannot promise. The new-currency option is wrong because a draft moves existing rupees and is not a separate money. The barter option is wrong because rupees settle the deal, not a goods-for-goods swap of papers. The extra-rupees option is wrong because neither a draft nor a cheque creates new money.

32. (D) A debit card spends the holder's own balance at once (Riya), while a credit card borrows money the bank advances and the holder repays later (Sahil). The swapped option reverses the two. The both-debit option ignores that Sahil's money was advanced by the bank, not drawn from his balance. The both-credit option ignores that Riya's own money left her account immediately.

33. (C) A transfer only moves money: 600 minus 250 leaves 350 in A, and 100 plus 250 gives 350 in B, keeping the total at 700. The rise option wrongly claims the bank mints new rupees during a transfer. The fall option wrongly claims money is destroyed in transit. The gold option wrongly claims UPI converts rupees into metal; UPI simply moves the same currency.

34. (D) Because cash, card, and UPI all spend the same rupee balance in one account, UPI is plainly a method, not a new currency. The days-of-the-week option is false and would not prove anything about currency anyway. The different-unit option is false, since UPI shows rupees. The never-back-to-cash option is false, because UPI balances are ordinary rupees that can be withdrawn as cash.

35. (D) All four are rupee payments differing only in method, so the same 50 rupees moves in each case. The cash-only option wrongly brands cheque, card and UPI as barter, though all use money. The different-currency option is false, since all are rupees. The new-rupees option is false, because moving money by any method creates no fresh currency.

36. (C) Trade moved from barter to coins and notes and most recently to electronic transfers, giving that order. The first wrong arrow runs the timeline backwards. The second wrongly places barter after coins. The third wrongly puts electronic transfers before coins and notes, though digital payment is the newest stage.

37. (D) The order is barter first, then commodity money like cowries, then minted metal coins, then paper currency. The first wrong option puts commodity money before barter and coins after paper. The second wrongly starts with coins and places barter after them. The fourth reverses the whole sequence, starting with paper and ending with barter.

38. (C) The correct summary captures the evolution, the trust-and-RBI basis of modern money, and that digital methods just move rupees. The always-existed option triple-fails: money came after barter, modern money is fiat not metal, and UPI is no new currency. The

identical option wrongly equates barter with money and repeats the precious-paper trap. The digital-first option inverts the timeline and falsely values notes by metal weight.

39. (B) A torn note still spends because, as R states, its value rests on trust and Reserve Bank backing, not on the paper, so both are true and R explains A. The 'does not explain' option is wrong because R is precisely the reason A holds. The 'R is false' option is wrong because trust and backing genuinely are the source of value. The 'A is false' option is wrong because a worn note really does keep its face value.

40. (A) A is true because UPI only moves existing rupees, leaving the total unchanged, but R is false because UPI creates no new money, so the answer is A true, R false. The first two options wrongly accept R as true. The last option wrongly rejects A, though a transfer plainly does not alter the country's total money.

41. (C) The coin spends at full value despite cheap metal because, as R says, it is fiat money trusted and made legal tender, so both are true and R explains A. The 'does not explain' option is wrong because R is exactly the reason. The 'R is false' option is wrong because modern coins genuinely are fiat money. The 'A is false' option is wrong because such coins truly do spend above their metal worth.

42. (B) A correctly describes the double-coincidence problem in barter, and R correctly states a fact about money, but R is about money's cure, not about why barter has the problem, so R does not explain A. The 'correctly explains' option is wrong because R answers a different question (how money fixes it) than A poses (what barter requires). The 'R is false' and 'A is false' options are wrong because both statements are individually true.

43. (B) Since fiat money works only on trust, losing trust would make people refuse the notes and break down money-based trade. The precious-metal option is fantasy; paper does not become metal. The worth-more option is backwards, since lost trust lowers, not raises, acceptance. The barter-impossible option is wrong, because if money failed people would more likely turn back to barter, not find it impossible.

44. (C) Not finding a willing partner is the double-coincidence failure; failing to agree a pots-per-blanket ratio is the lack of a common measure of value; a large pot unable to pay for a small needle is indivisibility, giving that exact order. The other options reshuffle these labels or introduce store-of-value and portability defects that none of the three woes actually describes.

45. (A) Divisibility is the property that lets money be split for a small buy, curing indivisibility, so that row is right. Durability cures perishability, not disputes over value ratios. Portability cures the burden of carrying, not mismatched wants. Wide acceptance cures mismatched wants, not spoilage. Each wrong row pairs a real money feature with a trouble it does not actually fix.

46. (D) P is correct, since barter persists in pockets such as some fairs alongside money. Q is wrong because a note's worth comes from trust and backing, not from any gold in the paper. R is wrong because UPI moves ordinary rupees and is no separate currency. S is wrong because barter came first and money was invented afterwards.

47. (A) Money's wide acceptance plus its roles as measure and store of value together overcome barter's central troubles, making it the best reason. The precious-metal option is false, since modern money is fiat and can lose value to inflation. The stop-producing option is absurd, as money still buys real goods that must be made. The same-product option describes the opposite of what money does; it frees traders from needing matched wants.

48. (D) The correct fix names real barter faults and grounds a note's value in trust and backing, repairing both errors. The first wrong option repeats both mistakes. The second invents a 'cheap paper' problem barter never had and keeps the precious-paper idea. The third clings to 'barter was perfect' and to a gold-paper notion, fixing neither error.

49. (C) Legal-tender status means the coin must be accepted to settle payment, so a shopkeeper cannot lawfully refuse it. The foreign-only option contradicts the meaning, since legal tender works within the country. The precious-metal option is wrong because legal tender is about acceptance by law, not metal content. The turn-it-away option is the opposite of legal tender, which removes the right to refuse it.

50. (D) Both wants and price are already agreed, so the only remaining block is that a whole camel cannot be split to match a tiny purchase, which is indivisibility cured by divisibility. The double-coincidence option is ruled out because the wants already match. The common-measure option is ruled out because the rate is already agreed. The store-of-value option is wrong because nothing is spoiling; the issue is splitting.

51. (A) A cheque shifts the same rupees between accounts, sparing the buyer from carrying and risking cash, which is the real advantage. The extra-rupees option is false, since a cheque creates no money. The more-valuable option is false, because the rupees keep their value. The barter option is false, because money still settles the deal; no goods-for-goods swap occurs.

52. (C) Claim (i) correctly defines barter and claim (ii) correctly contrasts early metal-valued coins with modern fiat money, so both are right. Claim (iii) is false because UPI only moves existing rupees and creates none. Any combination that includes (iii), such as the second, third, or 'all three' options, must be wrong, leaving (i) and (ii) only.

53. (C) A common measuring-unit lets every good carry one comparable price, so comparisons are instant, while barter forces a separate ratio for each pair, which is why X is faster. The equal-weight option is false and not how a measure of value works. The

same-product option describes the opposite of a healthy market. The preserve-forever option confuses a measure of value with durability, which is a different property.

54. (B) The root error is assuming a note's worth lies in its material; it does not, because notes are fiat money valued by trust and backing, so there is no precious material to double. The arithmetic option keeps the false premise and only quibbles over the multiple. The single-note option still treats the paper as precious. The no-error option fully accepts the precious-paper trap the chapter warns against.

55. (C) Without banks, the account-based services of safe saving and electronic transfer collapse, which is the direct effect. The farming option is wrong because growing crops does not depend on banks issuing seeds. The walking option is absurd, since paths are not bank-funded. The language option is absurd, since speech does not depend on bank records. Only money-handling services hinge directly on banks.

56. (C) Minting gave coins a fixed weight and certifying stamp, ending the weigh-and-test chore, and paper notes, being light, solved the burden of carrying many heavy coins. The first wrong option misassigns weighing to commodity money and ignores that paper came before digital for the weight problem. The second reverses the two stages. The fourth wrongly credits barter and commodity money, neither of which addressed these specific problems.

57. (B) Comparing priced tags uses money as a common measure of value, and then paying on the spot uses it as a medium of exchange, in that order. The store-of-value and deferred-payment labels in the first option fit neither act, since nothing is saved and nothing is owed for later. The second option mislabels reading a tag as exchange and paying as storing. The fourth wrongly calls comparison a deferred payment and an on-the-spot payment a measure of value.

58. (B) Salt's worth is its usefulness as a good, the silver coin's worth is its actual metal, and the modern note's worth is trust and law, so that order runs from material/usefulness toward trust. The first wrong option reverses the whole ranking, putting the trust-based note first. The third interrupts the order by placing the note ahead of the metal coin. The fourth scatters the three, breaking the smooth material-to-trust progression.

59. (B) Saving over many years exposes the weakness that goats sicken, age, or die, making them a poor store of value, which is the main worry. The easy-to-divide option is false, since live goats are hard to split, not too easy. The fiat option is wrong because goats are commodity goods, not fiat money created by law. The too-portable option misuses portability and is not a real saving risk.

60. (A) Money was invented to cure several barter faults together, so abolishing it would revive all of them, which is the strongest objection. The perishable option is wrong, since money does not physically preserve goods; it stores value, not the goods themselves. The

never-existed option contradicts the chapter, which says barter came first and even survives today. The unchanged option falsely claims barter and money are identical, ignoring all the faults money fixed.
